

CRM Audit Report

CRM Inspectability & Friction Diagnostic

HubSpot · 853 rows analyzed

13/08/2026 · Anthony Abreu

72.4 / 100

TO WATCH

Weighted average of the 5 indicators (governance x3) — details on next page

You pay for 853 contacts. Usable: 68 identified → 66 delivered.

GDPR COMPLIANCE — HANDLE BEFORE ANY OUTREACH

443 of 853 contacts (51.9%) are legally unusable as they stand.

THIS FIGURE IS A MINIMUM — calculation method detailed in the appendix.

68 / 853

230

436

■ A · Ready to contact · 15% ■ B · To enrich · 6% ■ C · To re-engage · 27% ■ D · Unusable · 1%
■ E · To purge · 51%

WHERE IT STARTS

Main lever: Consistency, at 53.9%. Fixing it is worth +9.2 points of overall score.

> **Exclude the 11 legally unusable contacts from all outreach**

Done when: The 11 contacts are out of every marketing list and sequence

Then 4 more actions within 30 days, each quantified.

03	What this database costs you today	5
04	Recommendations ranked by impact and effort	6
05	30 / 60 / 90 days	8
06	Who owns the base, and in what condition	10
07	What can you actually segment on	11
08	Where your funnel stops being measurable	12
09	Before you import: what was checked	13
10	The detail, field by field	15

Sections vary from one audit to the next: a page whose subject is absent from the export is not produced, rather than delivered empty. Numbering therefore follows the pages actually present in THIS report.

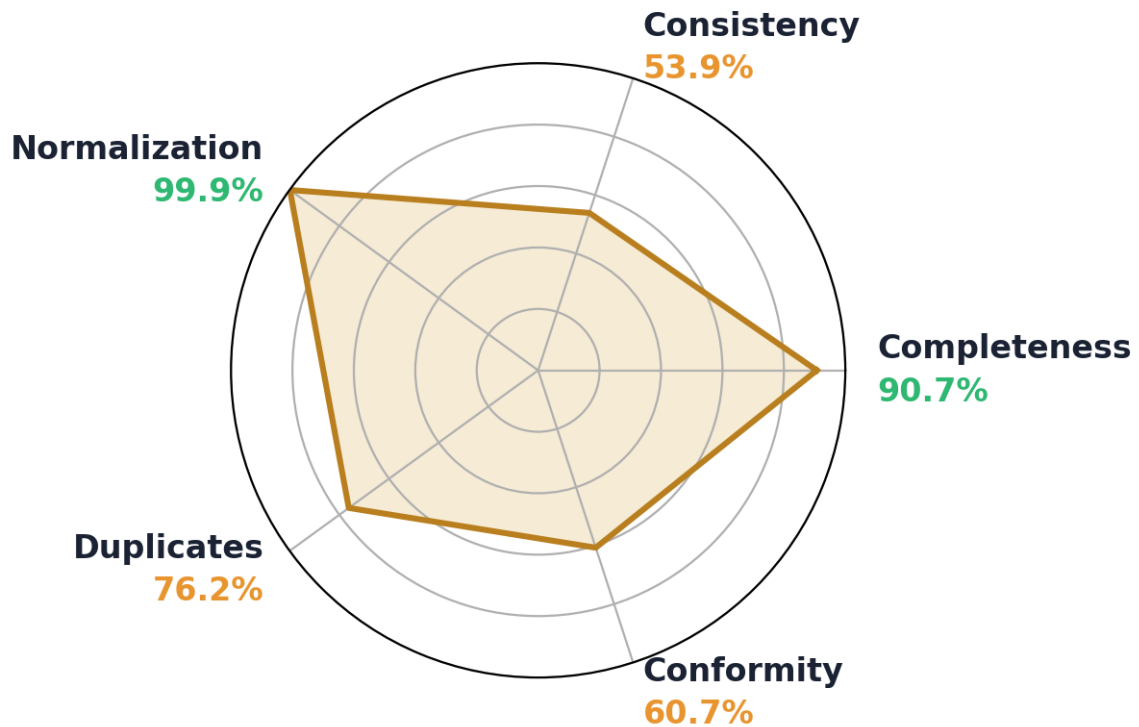

01 · DIAGNOSTIC

Inspectability Diagnostic

The single source of truth

The 5 indicators in detail

● $\geq 80\%$ Reliable ● 50-79% To watch ● $< 50\%$ Critical

Focus on CRM Conformity

234

Contact owner missing · 27.4 %

134

Lead Status undefined · 15.7 %

With 234 missing « Contact owner » and 134 undefined « Lead Status », your commercial activity is not inspectable. In revenue operations the rule is strict: if an action is not recorded in the CRM, it did not happen. You lose the ability to measure effort and forecast sales.

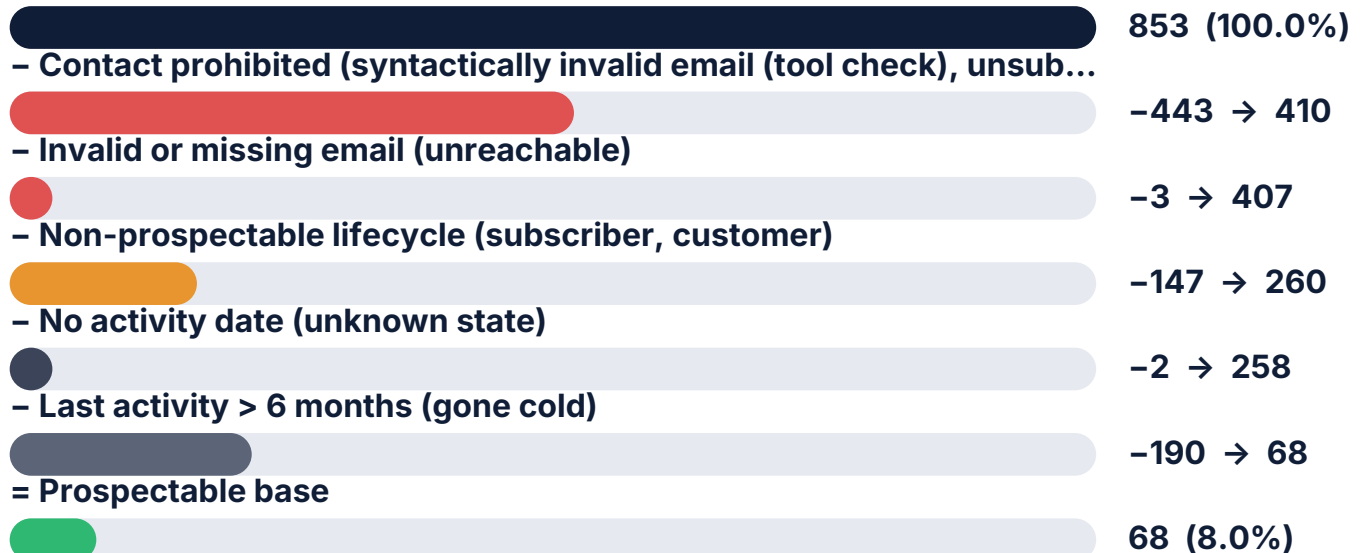

02 · FRICTIONS

Friction Mapping – Flywheel

From raw volume to actionable opportunities

Total base

How to read: each step removes records from the previous one, and a record with several issues is removed only once. The three figures below are per-category subtotals: they overlap.

The biggest lever is here: 443 records (51.9% of the base) drop out at a single step — are prohibited from contact. This is not a data defect: no correction will make them reachable. The only possible action is to remove them from your lists.

Technical friction: 86 duplicates to merge · 7 invalid emails · 4 unusable phone numbers.

Fully inactive duplicate groups

13 duplicate group(s) (27 records) have no living record left to keep: every copy has been inactive for over a year. These records are excluded from automatic merging and moved to the « Inactifs » tab — they must be reviewed manually (re-engage or archive) before being definitively discarded.

Records neither warm nor dead

307 inactive leads to arbitrate in committee · 2 records (0.2%) with no activity date at all: neither warm nor dead, simply non-inspectable.

03 · QUANTIFIED IMPACT

What this database costs you today

HubSpot only bills marketing contacts — the others are stored for free

471 contacts to move to non-marketing

That is 55.2% of your base. Two partially overlapping sources: 443 legally unusable contacts (syntactically invalid email (tool check), hard bounce recorded, unsubscribed from all emails, and 2 more reason(s), retention period exceeded) and 86 duplicates due to be merged — a single record can fall into both, so the total above is not their sum.

AMOUNT DELIBERATELY NOT QUANTIFIED

HubSpot billing tiers vary with your contract, currency and negotiated discount. We do not convert this volume into money until you provide your actual cost per marketing contact: a generic figure would be an invented one. Send it over and we will compute the exact saving.

PLEASE NOTE — Moving contacts to non-marketing only takes effect at your next billing update date, never immediately. Also, exceeding a tier is billed until contract renewal and cannot be cancelled mid-period.

Where these contacts come from

- Contacts excluded from all prospecting (syntactically invalid email (tool check), hard bounce recorded, unsubscribed from all emails, and 2 more reason(s)): they will never receive your emails, yet they are still billed as long as they are flagged 'marketing'.
- Contacts with no inbound signal for over three years: keeping them exceeds the retention period recommended by the CNIL for a non-customer prospect.
- Duplicates due to be merged: every duplicate record is billed separately until the merge is actually performed in HubSpot.

04 · WHERE TO START

Recommendations ranked by impact and effort

Three families of actions, in the order they should be tackled

READING GRID: Sales-Led MODEL

Your commercial model decides what blocks you: in direct sales, a contact with no phone is unusable; in self-serve, it is normal.

Active outbound prospecting: your reps need a number and a named owner. Without both, the record cannot enter any prospecting sequence.

237 critical and 0 important contacts UNDER THIS MODEL — a different model would give a different count on the same file.

99 qualified contacts have no owner: the marketing-to-sales handoff is broken. These contacts show up in no data-quality metric — all their fields may be filled — yet nobody is working them.

3 qualified lead(s) out of 398 have had NO contact attempt at all. The SLA is not late on them: it never started.

Median time to pick-up: 0.0 day(s) between qualification and owner assignment (398 record(s) measured). 2 beyond the declared 24 h threshold. This is not the time to CONTACT — no HubSpot export carries the timestamp of the first call. It is its floor: a lead assigned after three weeks cannot have been contacted within 24 h.

QUICK WINS

high impact · low effort · this week

- Exclude the 11 excluded contacts (syntactically invalid email (tool check), hard bounce recorded, unsubscribed from all emails, and 2 more reason(s)) from every campaign — immediate action, legal and deliverability risk removed.
- Merge the 85 duplicate groups identified, following the 'Certain_duplicates' tab of the Excel report (importing alone does not merge).
- Move 471 contacts to non-marketing: direct effect on the HubSpot bill, with no data loss.
- Decide what to do with the 436 contacts beyond the retention period: deletion or hashed suppression list.

Recommendations ranked by impact and effort (continued)

STRUCTURAL

high impact · real effort · to plan

- Assign an owner to the 234 orphan records: with no owner, no follow-up is steered or measurable.
- Make blocking fields mandatory at creation (valid email, owner) to stop unusable records at the source.
- Add validation rules on forms and integrations: that is where placeholder values and malformed emails are born.
- Investigate why 2 records have no activity date at all: they are invisible to steering, neither warm nor dead.

LONG TERM

delayed effect · lasting

- Set up a quarterly data-quality review, using the governance score as the metric tracked over time.
- Document a property dictionary: what each property is for, who fills it, and which values are allowed.
- Reduce the number of write sources into the CRM: every unaudited integration is a door open to inconsistent data.

05 · ACTION PLAN

30 / 60 / 90 days

Every action carries an owner and a measurable success criterion

Plan COMPUTED from this audit's figures and the Sales-Led model: each action carries its measured volume, and only appears if its subject exists in your base.

30 DAYS

ACTION	OWNER	SUCCESS CRITERION
Exclude the 11 legally unusable contacts from all outreach	CRM owner	The 11 contacts are out of every marketing list and sequence
Switch the 471 unusable contacts back to NON-MARKETING	CRM owner	HubSpot bill aligned: 471 fewer contacts in the marketing count
Assign an owner to the 234 unassigned records	Sales leadership	0 record without an owner (today: 234); assignment rule written down
Merge the 85 certain duplicate groups (same email address)	CRM owner	0 certain duplicate group left (today: 85)
Handle the 4 unusable phone numbers (missing, invalid, truncated)	Marketing / Ops	International format on every callable record (remaining: 4)

60 DAYS

ACTION	OWNER	SUCCESS CRITERION
Decide on the GDPR purge of the 436 contacts with no recent inbound signal	CRM owner	Written, dated decision on the 436 contacts: purge, anonymise or legal basis
Fill in the missing lead status on 134 records	CRM owner	0 record without a lead status (today: 134); qualification rule written down
Fix or clear the 7 unusable email addresses	CRM owner	0 invalid address left (today: 7) and bounce rate tracked
Make blocking fields mandatory at creation (email, owner)	HubSpot admin	No new record created without a valid email and an assigned owner

30 / 60 / 90 days (continued)

90 DAYS

ACTION	OWNER	SUCCESS CRITERION
Document the property dictionary and the data-entry rules	HubSpot admin	Dictionary published and known by the teams; sales onboarding updated
Set up a quarterly data-quality review	Sales leadership	Governance score measured and improving quarter over quarter

What this plan set aside, and why

The plan keeps six quantified actions at most so that it stays a plan. The anomalies below exist, are measured, and appear in the workbook — they simply do not have the volume of the six retained. They are listed here so the choice can be checked rather than merely accepted: it is VOLUME that set them aside, never the nature of the problem.

Anomaly set aside	Volume	Horizon it would have had
Instrument freshness: 2 records carry no activity date at all	2	90 days

A GDPR obligation is never set aside, whatever its volume: it opens its horizon. Only operational anomalies go through this cap.

Immediate next step

Open the README_import.txt file delivered with your CSVs and follow the step-by-step procedure. Once the import is done, merge duplicates in HubSpot using the « Doublons_certaines » sheet of the workbook: the import merges nothing by itself.

06 · PORTFOLIOS

Who owns the base, and in what condition

A fix is assigned to someone, not to a total

A total of 234 unassigned records does not say who should fix them. This table splits the base by portfolio and gives, for each, the share of records no campaign can reach — both email AND phone missing.

234 records (27.4%) belong to nobody. They are in no rep's queue, enter no follow-up sequence and appear on no activity dashboard: they are invisible to management until an owner is assigned.

Owner	Records	Share	No email	No phone	Unreachable
NO OWNER	234	27.4 %	0	1	0.4 %
karim.haddad@agence.example	208	24.4 %	1	1	1.0 %
marie.dupont@agence.example	207	24.3 %	2	2	1.9 %
lea.bonnet@agence.example	204	23.9 %	0	0	0.0 %

Is the problem individual, or systemic?

1.0 %

Average unreachable rate

1.9 pts

Max-min gap

0.8 pts

Standard deviation

1.0×

Load imbalance

ONLY A 1.9-POINT GAP between the best and worst portfolio (0.0% vs 1.9%). Everyone is at the same level, so nobody is at fault: the defect does not come from the reps but from the INTAKE PROCESS — forms, imports, integrations. Training the teams would change nothing. The fix is upstream.

Portfolios are balanced (1.0× between heaviest and lightest): the quality gap is not explained by a difference in workload.

Ranking is on the SHARE that is unreachable, never on volume: a 500-record portfolio at 5% is in better shape than a 40-record one at 50%. Ranking by volume would mechanically put the busiest rep at the top of the bad-pupil list.

07 · TARGETING

What can you actually segment on

A filled field is neither necessarily filterable nor necessarily valid

Segmenting assumes two things: that the field is FILLED IN, and that its value falls within a known reference set. Both are measured separately, and it is the gap between them that decides what you can target.

Targeting axis	Source column	Filled	Usable	Verdict
Country	Country/Region	100.0 %	100.0 %	Filterable
Industry	Industry	100.0 %	—	Not measurable
Company size	Number of Employees	100.0 %	—	Not measurable
Job title	Job Title	100.0 %	—	Not measurable
Company	Company Name	100.0 %	—	Not measurable
City	City	100.0 %	—	Not measurable

Your fields are filled in. Are they usable?

Email address: 4 values out of 850 do not match the expected format (99.5% conformity). They are filled in, therefore invisible to any completeness check — but unusable in campaigns, syncs or billing. An empty cell is seen; a wrong value is believed.

Field	Source column	Filled	Conforming	Rate	Example of deviation
Email address	Email	850	846	99.5 %	jean@ (sans domaine)
Phone	Phone Number	853	849	99.5 %	+3312345678 (court)

"Not measurable" does not mean "bad": it means no reference set can settle this field automatically (a job title or a company name is free text). The fill rate remains a fact.

08 · FUNNEL

Where your funnel stops being measurable

A headcount per stage says nothing about the state of its records

A stage is manageable only if you know WHO works it and WHEN it last moved. With no owner, no follow-up is assigned; with no activity date, no conversion delay can be computed. Rows follow funnel order, never volume: a funnel is not read out of sequence.

Lifecycle stage	Records	Share	No owner	No date	Stalled	Unmanageable
subscriber	147	17.2 %	49	0	113	33.3 %
lead	167	19.6 %	42	0	133 (79.6 %)	25.1 %
marketingqualifiedlead	142	16.6 %	37	2	111 (78.2 %)	26.1 %
salesqualifiedlead	141	16.5 %	35	0	117 (83.0 %)	24.8 %
opportunity	115	13.5 %	27	0	93 (80.9 %)	23.5 %
customer	141	16.5 %	44	0	105	31.2 %

454 records have not moved for over 365 days while sitting in an IN-FLIGHT stage (80.4% of those stages). They are neither won nor lost: they inflate the pipeline without contributing to it, distort any forecast based on open-deal counts, and clutter the reps' dashboards. An in-flight stage that has not moved in a year calls for a decision — revive or close — not one more follow-up.

EXIT stages (customer, evangelist, subscriber, other) are excluded from this total: a customer with no activity for a year is not a stuck deal, it is a customer. Flagging them would make a healthy base look like a failure and would erode the alerts that matter.

"Unmanageable" keeps the worse of the two gaps, not their sum: a record with no owner AND no date is counted once. The figure is therefore a minimum.

09 · RELIABILITY

Before you import: what was checked

What this report guarantees, and what you still need to verify

Object and definition coverage

- Portal definitions provided (40 file(s), most recent dated 2026-07-16).
- Detected HubSpot object: contact
- Coverage: 28/30 columns recognized (93%)

Dropdowns and checkboxes

- 1113 list value(s) specific to the origin portal (custom options): no action needed if re-importing into the same portal; only review when migrating to a different portal.
- 2 column(s) not checkable offline (dynamic lists: owners, teams, lifecycle stage, pipelines) — review by eye, see the 'Diagnostic_definitions' sheet.
- CAUTION — Definition provenance NOT DECLARED: cautious reading applied. Nothing in an export says which portal a set of definitions came from, and we do not guess. The values above are therefore presented as informational. If those definitions do come from the destination portal, those same values will be REJECTED at import.

Decisions already made automatically

- 86 record(s) merged as duplicates and removed from the re-import file.
- 5 email(s) fixed or blanked in the re-import file.
- Row-by-row detail: 'Decisions_a_valider' sheet in the Excel file — review before sending the file to the client.

How the GDPR figure was computed

11 excluded from all prospecting — reason(s) actually found in THIS file: syntactically invalid email (tool check), hard bounce recorded, unsubscribed from all emails, and 2 more reason(s) · 436 beyond 3 years with no inbound contact (CNIL retention period).

Age measured as of 2026-07-18, from the last INBOUND contact (outbound follow-ups from your team do not reset this clock).

Before you import: what was checked (continued)

THIS FIGURE IS A MINIMUM. With no inbound engagement date in this export, age is measured on 'Last activity' — which your own outbound emails and calls refresh. Legally expired contacts may therefore look recent and be missing above. For an exact count: re-export including 'Recent Conversion Date' and 'Last Engagement Date'.

What this report cannot guarantee

- Dynamic options (owners, teams, lifecycle stage, pipelines) cannot be validated offline: a wrong value on these fields may go unnoticed.
- A bulk import can trigger workflows on the properties it changes (lifecycle stage, status...): pause them before a large import, then re-enable.
- Always test on a small batch in 'update only' mode before the full import, especially for a new portal.
- ATTENTION — Portal time zone NOT DECLARED. HubSpot exports dates in the PORTAL's configured time zone, which is neither UTC nor necessarily yours: measured on a real portal, an import run at 6:25 PM Paris time comes out of the CSV as "12:25". A portal left on a US time zone therefore dates anything happening between midnight and 6 AM your time to the PREVIOUS DAY. GDPR age can be off by one day: only records within one day of the threshold change verdict. Check the setting under Settings > Account Defaults.

METHODOLOGY APPENDIX — THRESHOLDS APPLIED TO THIS AUDIT

Retention period (GDPR purge)	1095 days
Reference date for ageing	2026-07-18
Name similarity threshold	90 / 100
Inactivity qualifying a dead lead	365 days
Default country (phone normalisation)	FR
Output date format	%Y-%m-%d
Portal time zone (declared)	inconnu
Prospecting score weighting	Reachability=30 · Recency=25 · Engagement=20 · Potential=15 · Completeness=10
Axes not measurable in this export	engagement
Governance score weighting	completeness×2 · consistency×2 · normalization×1 · duplicates×2 · crm_conformity×3
Audited file	sample_853.xlsx — SHA-256 28aee3e79fee8889713c97e86e739d6c...
Tool version	3.14.0

10 · APPENDIX

The detail, field by field

What is filled, what is verified — and what could not be

An empty field and a wrong field are not fixed the same way, and the second one costs more: it passes every completeness check, shows up in segments, and is only discovered when the campaign bounces. The two columns below separate them — **filled** counts non-empty cells, **usable** also removes those whose value does not match the expected format.

Field	Role	Filled	Usable	Empty	Invalid
State/Region	—	0.0 %	—	853	—
Legal basis for processing contact's d	key	66.7 %	—	284	—
Contact owner	critical	72.6 %	—	234	—
Lead Status	key	84.3 %	—	134	—
Email	important	99.6 %	99.2 %	3	4
Phone Number	critical	100.0 %	99.8 %	0	2
Company Name	important	100.0 %	—	0	—
Job Title	important	100.0 %	—	0	—

2 of 19 columns carry a verifiable format rule (Email, Phone Number). For the other 17, the « invalid » column shows a dash and not a zero: **no rule was applied**, and a zero would suggest a check that passed. Their « usable » rate therefore equals their fill rate — that is a ceiling, not a result. 11 column(s) with no unusable cell and no weight in the GTM model are not listed above: they would teach nothing. The audit workbook contains them all.

What this audit could not measure, and why

A missing field is **not** a field at zero: **the tool declares the measurement impossible and removes it from the calculation**, rather than punishing a score for what it was never given. The price is in the table — 13 property(ies) absent from the export close 4 measurement(s) that the next export can reopen.

The properties listed are the ones the tool will look for on the next run: **add them in the column picker when exporting** — nothing needs to change on our side. One exception, the last row: those columns are already in the file, it is the **column_mapping** that needs completing. Snapshot as of 2026-07-18. Replaying the same audit on a later export, same tool, yields a directly comparable score — the only way to know whether quality is improving or degrading.

The detail, field by field (continued)

What is missing	Properties concerned	What it closes, in THIS report
Engagement signals	Recent Conversion Date, Number of Form Submissions, Number of times contacted, Number of Sales Activities, HubSpot Score	The Engagement axis of the prospecting score is declared NOT MEASURABLE : its weight is redistributed over the other three.
Deliverability state	Invalid email address, Additional email addresses	An address HubSpot already knows to be dead (unsubscribed, quarantined, hard bounce) still counts as contactable here: the prospectable base shown is an UPPER BOUND .
Legal basis and marketing status	Marketing contact status	The GDPR purge relies on age alone, with no legal basis to confirm it: the figure shown is a MINIMUM .
Commercial value	Number of Associated Deals, Total Revenue	No crossing between the quality of a record and what it earned: impact figures come from the config, not from your history.
Attachment and origin	Mobile Phone Number, Company Domain Name, Record source	No second number when the first is invalid, no domain to match two records of one company, no channel in targeting.
Present, but not recognised	Original Traffic Source, Industry, State/Region, Website URL, Associated Company, Opted out of email: Marketing Information, Became a Marketing Qualified Lead Date	The data is there, but the tool does not know what it is meant to hold: counted for fill rate, never normalised nor checked . Declare the ones your targeting depends on in column_mapping .
